Special Issue

In Vitro Tuberization of Potato and Tuber Crops

Message from the Guest Editor

Potato is the third most important food crop in the world after rice and wheat in terms of human consumption. As it is vegetatively propagated, huge amounts of virus-free planting material (i.e., seed potatoes) are needed annually worldwide. In vitro microtubers may offer advantages for the storage and transport of pathogenfree germplasm over cuttings in the seed production system. Numerous studies from many countries during the last three decades reported that the in vitro tuberization of potato is influenced by the carbon and nitrogen source of the medium, plant growth regulators, culture conditions (temperature and photoperiod) and systems, etc. In addition to in-depth physiological studies, comprehensive and systematic studies are needed to develop the microtuber seed production system which will be released on the commercial market. This Special Issue is focused not only on potato but also on other tuber-bearing crops, such as vams. lilies, etc. We welcome research articles and reviews that address any aspect of the in vitro tuberization of potato and other tuber crops.

About the Journal

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in Sustainability, an international open access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. The journal publishes original research articles, reviews, conference proceedings (peer reviewed full articles) and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.
