

Special Issue

New Advanced Techniques for Assessing Soil Chemistry

Message from the Guest Editor

A good knowledge of the soil chemistry status is of great interest regarding important topics such as soil fertility, contamination problems, eutrophication, acidification, and climate change. Lately more advanced tools for assessing soil chemistry have been developed, e.g. X-ray absorption spectroscopy (XAS) for speciation of nutrients and potentially toxic elements, and synchrotron μ -XRF, which can show spatial distribution patterns in the soil and correlations of elements in space. Another set of valuable tools for evaluating soil chemistry include geochemical models for speciation, solubility prediction, weathering, nutrient cycling, acidification, eutrophication, and the transport of elements. Since soils often have a complex composition and can be highly heterogeneous, it is seldom enough with only one technique for a full view, therefore studies with a combination of techniques are highly valuable. The scope of this Special Issue is to highlight new, state-of-the-art research regarding these topics, in order to better evaluate the soil chemistry status of soils around the world.

About the Journal

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in Sustainability, an international open access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. The journal publishes original research articles, reviews, conference proceedings (peer reviewed full articles) and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.

Editor-in-Chief

Prof. Dr. Steve W. Lyon
School of Environment and Natural Resources, Ohio State University,
Columbus, OH 43210, USA

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE and SSCI (Web of Science), GEOBASE, GeoRef, Inspec, RePEc, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Environmental Studies) / CiteScore - Q1
(Geography, Planning and Development)
