Building Renovation—Towards a Decarbonized Building Stock 2050

Message from the Guest Editors

The building sector accounts for approx. 40% of primary energy use and associated CO₂ emissions, and it is expected that 85–95% of the existing building stock will still be here in 2050. Therefore, energy-efficient renovation and utilization of renewable energy sources will play a key role in the transition towards a low emission society. Most countries have already set ambitious goals for reducing energy use in existing buildings and, e.g., the EU has set a goal to have a completely decarbonized building stock by 2050. Renovation rates, however, are much too low at the moment (e.g., 1% per year in Europe), and there is a need for strategies and initiatives that can speed up the process considerably if ambitious goals are to be reached. This Special Issue intends to present a selection of papers addressing a wide range of approaches and tools, with the objective of promoting an effective transition to a low carbon economy focusing on the key elements of the renovation strategy. About the Journal

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in Sustainability, an international open access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. The journal publishes original research articles, reviews, conference proceedings (peer reviewed full articles) and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.

Editor-in-Chief
