# Techno-Sustainable Biowaste Management Strategy

### Message from the Guest Editors

Dear colleague, Composting is the main treatment option in the EU for separately collected biowaste, but anaerobic digestion, with biogas production, is increasing. However, a high proportion of biowaste still ends up in the mixed waste that is incinerated, even in many countries with well-established separate collection systems. To enable biowaste to be used as a source of high-quality fertiliser and soil improver as well as feedstock for the biotechnological production valueadded chemicals, it needs to be collected separately at source while keeping impurity levels low. Quality standards and quality assurance processes for compost, digestate, fertilisers and soil improvers as well as fermentation media help to build trust in them and are an integral part of a good biowaste management system. Research and innovation increasingly explore the opportunities for using biowaste, mainly from food processing, as a new source of higher-value products such as volatile fatty acids and biofuels, but many challenges remain.

# **About the Journal**

## Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in Sustainability, an international open access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. The journal publishes original research articles, reviews, conference proceedings (peer reviewed full articles) and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.

### Editor-in-Chief
