Resource Price Fluctuations and Sustainable Growth

Message from the Guest Editors

It has become a pressing issue around the globe to utilize natural resources in a sustainable manner to achieve green growth of the economy and society. The resource curse hypothesis posits that there is a negative correlation between resource dependence and sustainable growth in an economy. Many studies have tested the theory of the resource curse. However, scholars have not taken resource price fluctuations into consideration. In resource-rich areas, the resource industry makes up a large portion of the national economy, and resource price fluctuations exert a greater influence on local economic growth. In a global economic boom, resource demand increases rapidly, leading to a gradual growth in resource prices and resource industry investments, which then promotes rapid economic growth in resource-rich areas. Meanwhile, in a global economic recession, resource demand shrinks, leading to a fall in resource prices and resource industry investments, which leads to a decline in economic growth.

About the Journal

Message from the Editor-in-Chief

I encourage you to contribute a research or comprehensive review article for consideration for publication in Sustainability, an international open access journal which provides an advanced forum for research findings in areas related to sustainability and sustainable development. The journal publishes original research articles, reviews, conference proceedings (peer reviewed full articles) and communications. I am confident you will find the journal contributes to enhancing understanding of sustainability and fostering initiatives and applications of sustainability-based measures and activities.
