Left–right asymmetry is an important characteristic of the brain, as we now know from studies of many vertebrate species and, more recently, from studies of invertebrates. The commonality of this feature of the brain suggests that it affords all, or many, brains advantages in cognitive processing by, for example, allowing parallel and different processing of inputs on each side of the brain and by each side controlling different sets of outputs [...]

Symmetry is ultimately the most important concept in natural sciences. It is not surprising then that very basic and fundamental research achievements are related to symmetry. For instance, the Nobel Prize in Physics 1979 (Glashow, Salam, Weinberg) was received for a unified symmetry description of electromagnetic and weak interactions, while the Nobel Prize in Physics 2008 (NambuKobayashi-Maskawa) was received for the discovery of the mechanism of spontaneous breaking of symmetry, including CP symmetry. Our journal is named Symmetry and it manifests its fundamental role in nature.
