Symmetry in Fixed Point Theory and Applications

Message from the Guest Editors

There are various types of differential and integral equations that arise from problems in engineering, physics, chemistry, and economics, among others. The existence and uniqueness of these equations' solutions have always been major concerns for researchers. The theorems of fixed point and the measure of non-compactness are potent tools for demonstrating the existence and uniqueness of numerous equations of this type. These equations may also be fractional differential equations, fractional integral equations, fractional differential inclusions, or fractional integral inclusions. Numerous researchers are interested in the existence and uniqueness of solutions for systems of differential equations, integral equations, and their fractional types. In addition, many authors are interested in non-compactness measures for numerous Banach spaces.

About the Journal

Message from the Editor-in-Chief

Symmetry is ultimately the most important concept in natural sciences. It is not surprising then that very basic and fundamental research achievements are related to symmetry. For instance, the Nobel Prize in Physics 1979 (Glashow, Salam, Weinberg) was received for a unified symmetry description of electromagnetic and weak interactions, while the Nobel Prize in Physics 2008 (Nambu, Kobayashi, Maskawa) was received for the discovery of the mechanism of spontaneous breaking of symmetry, including CP symmetry. Our journal is named *Symmetry* and it manifests its fundamental role in nature.

Editor-in-Chief

Prof. Dr. Sergei Odintsov
