Message from the Guest Editor

Respirable particulate matter (PM) has been regarded as a “criteria air pollutant”, along with carbon monoxide, ground level ozone, fine- and ultra-fine particulate matters, diesel/biodiesel particles, metal particles (lead, palladium, etc.), nitrogen dioxide, and sulphur dioxide. The source of air pollution is two pronged—outdoor and indoor air pollution. Epidemiological evidence indicates the association of chronic respiratory diseases like asthma and chronic obstructive pulmonary disease (COPD) to ambient PM exposure.

Therefore, this Special Issue will cover the most recent research on air pollution related respiratory diseases:

Respiratory toxicity following exposure to air pollutants.

Outdoor and indoor air quality monitoring: special focus on LMIC.

Gender perspective air pollution (indoor and outdoor) mediated respiratory adverse outcome pathways.

Acute and repeated exposure to ambient gaseous and particulate matters using advanced/physiologically-relevant in vitro models.

Air pollutant and molecular pathogenesis for COPD onset: in vivo to human study.
