

Joint Special Issue

Progresses in Hematopoietic Stem Cell Transplantation and Cellular Therapies

Message from the Guest Editors

Hematological malignancies are considered to be one of the most important causes of mortality and morbidity in the modern world. The current joint Special Issue aims to present a modern approach in recent advances in stem cell transplantation for the hematological patient, with a special emphasis on progress in conditioning chemotherapy and cellular therapies. The present call for manuscripts is addressed at healthcare professionals that diagnose, treat, and do research in stem cell transplantation, with a special emphasis on state-of-the-art therapeutics and novel, emerging drugs and novel cellular therapies. Comprehensive reviews, as well as research (be it basic, translational or clinical research) or even interesting case series or case reports are welcomed, with the goal to present new approaches in the clinical management of the patient, patients diagnosed with a malignancy and undergoing a stem cell transplantation, approaches that may be newly approved drugs, clinical trials on the pipeline or even promising future therapeutic alternatives.
