Resistance Mechanism and Therapy Options in *Acinetobacter*

Message from the Guest Editors

Acinetobacter baumannii is a Gram-negative pathogen that has acquired antibiotic resistance to multiple antimicrobial agents, making clinical treatment difficult. Although it is less commonly reported, antibiotic resistance infections caused by other *Acinetobacter* species are considered as an emerging threat. Moreover, this organism is included as one of the important pathogens in the WHO's global priority list of antibiotic-resistant bacteria. This establishes an urgent need for new therapies for combating this pathogen, such as applications of antimicrobial peptides and bacteriophage-based strategies. Therefore, in this Special Issue, we would like to invite research on both antimicrobial resistance and bacteriophage therapy in *A. baumannii*. Papers about the molecular mechanisms of resistance in *Acinetobacter* species are welcomed. Research on new antibiotic candidates or new treatments, as well as phage therapy, against *Acinetobacter* are also welcome.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. John Frean

Pathologist, Parasitology Reference Laboratory, Centre for Emerging Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, University of the Witwatersrand, Johannesburg 2192, South Africa

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, Informit, and other databases.

Journal Rank:

JCR - Q1 (Tropical Medicine) / CiteScore - Q2 (Public Health, Environmental and Occupational Health)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 22.2 days after submission; acceptance to publication is undertaken in 3.8 days (median values for papers published in this journal in the second half of 2025).
