Special Issue

Prospects for Schistosomiasis Elimination

Message from the Guest Editors

This Special Issue focuses on current efforts to limit the ravages of schistosomiasis with a view to eliminate this helminth, parasitic infection as a public health issue on a world-wide scale. Excellent progress has moved China and several countries in North Africa and the Middle Fast close to the elimination of schistosomiasis and this provides hope that the reign of the 'God of Plague' is near. The disease has, however, still a strong presence in sub-Saharan Africa with endemic areas stretching from Latin America to Southeast Asia putting more than 800 million people at risk, while the number of those actually infected remains as high as somewhere between 200 and 250 million people, the majority living in low- and middle income countries. Schistosomiasis is one of the neglected tropical diseases (NTDs) targeted by the World Health Organization for increased control and eventual elimination in the next 10-20 years. Morbidity control has in principle been achieved thanks to large-scale, repeated chemotherapy with praziquantel, but there are still areas with many cases of advanced disease.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. John Frean

Pathologist, Parasitology Reference Laboratory, Centre for Emerging Zoonotic and Parasitic Diseases, National Institute for Communicable Diseases, University of the Witwatersrand, Johannesburg 2192, South Africa

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, Embase, Informit, and other databases.

Journal Rank:

JCR - Q1 (Tropical Medicine) / CiteScore - Q2 (Public Health, Environmental and Occupational Health)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 20.6 days after submission; acceptance to publication is undertaken in 3.1 days (median values for papers published in this journal in the first half of 2025).
