Assessment of hydrological extremes is of paramount importance, as they have the potential to affect society in terms of human health and mortality, and also may have effects on the ecosystem and economy (e.g., infrastructure and agriculture). This Special Issue invites original research articles, as well as review articles, that address statistical analysis and stochastic modelling of hydrological extremes under current and future climate conditions. We are particularly interested in studies related to innovative stochastic and statistical approaches to analyze hydrological extremes. Potential topics include, but are not limited to:

- Decadal anomaly and trend analysis of historical hydrological extremes
- Anthropogenic and atmospheric drivers
- Assessment of uncertainties in hydrological projections and observations
- Application of statistical and dynamical downscaling methods
- Hydrological modeling under extreme conditions
- Early warning and forecasting systems
- Regional and global drought and flood analyses
- Adaptation and mitigation strategies
- Socio-environmental consequences of hydrological extremes

Message from the Editor-in-Chief

The relevance of water in human development and sustaining life, fuels general and scholarly interest in the world’s water resources. A better understanding of all aspects of water and its relation to food supply, energy production, human health, and the functioning of ecosystems is key in managing this precious resource in a sustainable, efficient and equitable manner. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications. We ensure a critical review process and a quick turnaround between submission and final decision.

Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High visibility:** indexed by the Science Citation Index Expanded (Web of Science), Ei Compendex and other databases.

**CiteScore 2017** (Scopus): *2.06*, which equals rank 43/191 (Q1) in the category 'Water Science and Technology' and 51/199 (Q2) in 'Aquatic Science'.
