### Message from the Guest Editors

Dear Colleagues,

Models of urban water infrastructure systems are widely used in many scientific and practical engineering applications. They are used to design new or optimize existing systems, or to understand the connection between the natural and human environments. Traditionally, the field is divided into drainage and water supply, on both technical and institutional levels.

While this segmentation into water supply and urban drainage is reasonable, for many applications these systems are technically linked or share the same space in the urban environment, and, as such, are influenced by the same drivers. To improve the integrated view of these two fields, we would like to especially invite research on integrated studies, in which different systems interact with each other, or in which synergies are used to model both systems. Additionally, manuscripts on the benefits of overarching methods and tools are invited.

## Message from the Editor-in-Chief

The relevance of water in human development and sustaining life, fuels general and scholarly interest in the world's water resources. A better understanding of all aspects of water and its relation to food supply, energy production, human health, and the functioning of ecosystems is key in managing this precious resource in a sustainable, efficient and equitable manner. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications. We ensure a critical review process and a quick turnaround between submission and final decision.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High visibility:** indexed by the **Science Citation Index Expanded** (Web of Science), Ei Compendex and other databases.

**CiteScore** (2018 Scopus data): **2.66**, which equals rank 39/203 (Q1) in 'Water Science and Technology' and rank 34/204 (Q2) in 'Aquatic Science'.
