

Special Issue

Novel Approaches to Nutrients and Pollutants Removal from Wastewaters

Message from the Guest Editor

The World Economic Forum ranks the water crisis in the top three global risks, while the General Assembly of United Nations (UN) proclaims the period from 2018 to 2028 as the UN Water Action Decade in order to improve educational outreach related to water and water pollution control and to improve communication to achieve water-related goals. For the achievement of those ambitious goals, effective water treatments, i.e., effective removal of nutrients and pollutants from wastewaters should be applied prior to their discharge into ecosystems. As for a Special Issue, I have the honour of inviting you to publish a feature paper in this issue, as your contribution to achieving UN Sustainable Development Goals, especially for Goal & Clean Water and Sanitation. Within this framework, for this Special Issue, I would like to invite original research contributions, review articles, as well as short communications that emphasize and gives an overview of the novel, approaches in wastewater treatment, especially focused on the latest achievements and novel techniques, materials, and methods for effective nutrient and pollutant removal from wastewater.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
