

Special Issue

The Impact of Water Environment Changes on Freshwater Fish Species

Message from the Guest Editors

We live in a rapidly changing world, and anthropogenic impacts on ecosystems are expected to intensify in the future, especially under conditions of increasing globalization and under current climate change scenarios. Freshwater ecosystems, which host an extraordinary variety of fish species among numerous other organisms, are particularly susceptible to the impacts of environmental change [...]. In this Special Issue, we invite contributions from all relevant research fields, investigating how changes in the freshwater environment influence fish species around the world. These include laboratory studies, focusing on the effects of specific biotic and/or abiotic factors, but also field studies looking at environmental change impacts at a larger scale. Brief communications, reviews, regular research articles, and meta-analyses will all be considered for publication. For further reading, please follow the link to the special issue website at:

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
