Special Issue

Marine Geologic Features and Processes in Siliciclastic, Carbonate, and Mixed Siliciclastic-Carbonate Systems

Message from the Guest Editor

Fluctuations in the relative sea level control the rate of the sediment supply, primary mineralogical composition, pore water chemistry, sediment budget and architecture of depositional systems. Sandstones consist of detrital grains such as quartz, feldspars and rock fragments. Hydraulic and fluid flow regimes produce sets of sedimentary structures, facies and facies associations. Studying facies and facies associations in siliciclastic rocks can be achieved by describing logs, seismic sections, outcrops and cores. In carbonate rocks, it is not uncommon that seismic and logs are not of significant help, the task of deciphering depositional environments requires a detailed petrographic assessment of facies and rock strata. Shelf settings consist of depositional environments, which produce the largest volume of modern carbonates and contain a significant volume of ancient carbonate sediments dominating the geologic record. In this Special Issue, we seek contributions on depositional environments to unravel the complexity of the interpretations of the depositional processes. Contributions on shallow burial post-depositional processes (diagenetic alterations) are also welcome.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Editor-in-Chief

Dr. Jean-Luc PROBST
Centre de Recherche sur la Biodiversité l'Environnement (CRBE) UMR CNRS/UPS/INPT/IRD, Centre National de la Recherche Scientifique (CNRS), University of Toulouse, Campus ENSAT, Auzeville Tolosane, Toulouse, France

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), Ei Compendex, GEOBASE, GeoRef, PubAg, AGRIS, CAPlus / SciFinder, Inspec, and other databases.

Journal Rank:

JCR - Q2 (Water Resources) / CiteScore - Q1 (Aquatic Science)
