

Special Issue

Sustainable Water Supply, Sanitation and Wastewater Systems

Message from the Guest Editors

Protecting the natural water environment is one of the most important issues in Asian countries. However, water pollution control in Asian countries is a difficult task due to rapid population and economic growth, and limited resources and investments. As a result of water pollution, pristine water sources are shrinking, and drinking water sources are under threat, causing detrimental health impacts and making it difficult to achieve SDG 6. Meanwhile, because of small investment costs and rapidly evolving technologies, decentralized water supply and wastewater systems could address the above-mentioned problems in Asian countries. This Special Issue aims to share the current issues, efforts and technological developments helping to achieve SDG 6 in Asian countries. We welcome papers on safely managed sanitation in Asian countries, including fecal sludge management and sewered vs. non-sewered systems, as well as studies on supplying safe drinking water via piped and individual sources, [...]

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
