Water Saving in Agriculture

Message from the Guest Editor

Irrigation is one of the main water uses, especially in arid and semi-arid regions. Without additional water supply, improving water saving is crucial in such areas to free up resources for other uses, and increasingly so in a climate change context. An optimized reallocation must be guided by principles based on the value of water scarcity and the maximization of social welfare. Alongside other regulatory and technological options, economic instruments may provide an operational set of water management strategies [...]

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Editor-in-Chief
