

Special Issue

Effects of Climatic and Anthropogenic Factors on Surface and Underground Waters

Message from the Guest Editor

This issue focuses on the quality and recharge process of nontoxic water from both surface and underground. Our focal points are surface/groundwater contamination due to various climatic and anthropogenic issues, drying up of streams/lake water bodies/springs and their rejuvenation and conservation. Providing an updated dataset on shrinkage of water bodies and evaluation of water quality using the Water Quality Index and Heavy Metal Pollution Index (HPI) should get priority.

- climate change and water
- total water storage
- GRACE and GLDAS
- LULC around water bodies
- WQI and HPI
- water protection

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
