Special Issue

Water Supply and Drainage for Sustainable Built Environment

Message from the Guest Editors

Collaborative research efforts to find feasible and practical solutions for improving water efficiency in buildings, while lessening the impacts of environmental quality, resources, and energy consumption can lead to advances in water supply and drainage for sustainable built environments. Related topics consist of, but are not limited to, drainage and sanitation, human behaviour and influences, rainwater and re-use of wastewater, smart appliances and systems, sustainability and standardisation, water and energy efficiency, water conservation, water guality and safety, water economics and pricing, water system life cycle, and water supply and demand management. All research outcomes are intended to contribute to the development of best management practices for water conservation and demand management in buildings.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Editor-in-Chief
