

Special Issue

Impact of Climate Change in Marine Resources, Their Habitats, and Associated Socio-Economic Systems

Message from the Guest Editors

We seek works that provide a better understanding of the interactions among systems, pressures, and threats, and exploited communities, and how these changes affect socioeconomic activities, biodiversity, and ecosystem services. Theoretical, conceptual, modeling, experimental, and review studies are welcome. Examples include papers around the effective effect of climate change in marine species distribution or production, the vulnerability of marine habitats, management options for exploited marine communities under climate change, or topics that address the complex issues of food and income security, ecologically sustainable development of the fisheries sector among others, such as the role of climate change on socioeconomic systems. Papers can be reviews, syntheses, viewpoints, meta-analyses, and original research relevant to the environment, ecology, biology, fisheries, policy, human development, and/or economy anywhere on the globe. Keyword: climate change; environmental variability; marine coastal systems; marine communities; fishery resources; species resilience; impact of extreme climatic events; socioeconomic effects

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
