

Special Issue

Ecosystems of Inland Saline Waters

Message from the Guest Editors

Inland saline waters include different types of water bodies (lake, lagoons, estuaries, rivers, springs, ponds, etc.) and play an important many face role in the Biosphere on different spatial scales. Their total area is very close to total area of freshwaters on the planet. Despite this, they attract much less attention then freshwaters. Currently, it is inadmissible due to some main reasons: 1. growing proccess of salinization of freshwater systems worldwide, 2. increasing demand for their human sustainable multi-purpose use, 3. their significant landscape role, including the conservation of aquatic organisms living in them and the related numerous bird species. This Special Issue aims to decrease lack of knowledge on these unique and diverse water bodies also providing information to environmental managers, polititions, and general public needed to the conservation and sustainable use, [...] For further reading, please follow the link to the Special Issue Website at:

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
