

Special Issue

Advance in Water Management and Water Policy Research

Message from the Guest Editors

Environmental damages in various parts of the world also affect policies and sustainable management of water resources. Limited access to water resources in a sustainable manner will have a serious impact on economic sectors, such as agriculture and plantations, forestry, fisheries, including sustainable community food security. One thing that is no less important is the need for sustainable environmental policies and management as a buffer for the future of water resources for human life around the world. This Special Issue aims to introduce some of these advances by addressing paradigmatic shifts in questions of privatization, public ownership, and common resource management; by investigating new and emergent forms of contentious water politics, by fostering new ways of analyzing water policies. The contributions may deal with different scales and dimensions of water management and water policy, such as hydro-diplomacy, the political economy of the water sector, policies on the water for food, water extractivism regimes, lawmaking on water, issues of WASH, and public health under conditions of the pandemic, and environmental justice themes connected to water.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.

Editor-in-Chief
