

Special Issue

Progress in Water Footprint Assessment

Message from the Guest Editors

We invite you to submit papers showing progress in Water Footprint Assessment, the interdisciplinary field studying water resources management in relation to food and energy consumption, supply chains, and production and trade patterns. We are particularly open to papers that use the water footprint and virtual water trade concepts to address questions on water-use efficiency, water dependencies, water risk and security, environmentally sustainable water use, and fair sharing of water. We welcome papers that apply the water footprint in integrated water resources management or river basin studies, and papers that go beyond the water footprint by considering different types of environmental footprints more comprehensively. This Special Issue will include innovative case studies focusing on specific geographic regions, products, sectors or businesses. We look for progress in, for example, the spatial resolution of assessment, the advancement in models employed, the capturing of uncertainties, the assessment of water footprint reduction strategies, and the translation of analytical results into policy implications.

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
