

Special Issue

Assessment of Spatial and Temporal Variability of Water Resources

Message from the Guest Editor

Sustainable water resources management occupies a prominent position in the global agenda. Improved knowledge on water resources availability, including their spatial and temporal variability, is pivotal to making progress towards sustainable development. Despite scientific progress in hydrology and water resources assessment, the current knowledge on water availability across a range of spatial and temporal scales (e.g., global, regional, river basin, inter- and intra-annual variability) is still limited, especially in view of the rapidly changing world. Water availability is changing both spatially and temporally because of the natural hydro-climatic variability and of global changes triggered by anthropogenic factors. This Special Issue aims to contribute to advancing the scientific knowledge related to water resources variability and availability. For further reading, please click: "[Assessment of Spatial and Temporal Variability of Water Resources](#)".

About the Journal

Message from the Editor-in-Chief

In the context of global changes, the sustainable management of water cycles, going from global and regional water cycles to urban, industrial and agricultural water cycles, plays a very important role on the water resources and on their relationships with food, energy, biodiversity, ecosystem functioning and human health. *Water* invites authors to provide innovative original full articles, critical reviews and timely short communications and to propose special issues devoted to new technological and scientific domains and to interdisciplinary approaches of the water cycles. We ensure a critical review process and a quick turnaround between submission and final decision.
