20 December 2023

Message from the Guest Editor

Dear Colleagues,

Education and Physical Activity are closely linked, just like the teacher and the student. Thus, several researches show how teachers' behaviors influence students, and how students' behaviors influence teachers. In recent years, numerous investigations have focused on knowing the didactic behaviors of teachers, and how they influence the behavior of students and their academic performance. In this line, various investigations have been carried out evaluating the effect of psychological variables in schoolchildren, due to educational interventions by teachers through various pedagogical practices and even using educational models. Similarly, the influence is the other way around, observing a relationship between student behavior and its influence on teacher behavior, job stress, job satisfaction, etc.
