Values inside the bracket are 1st and 3rd quartiles. Median and quartile values in the tables were indicated by multiplying 10^3. Cord blood samples were classified by 3 conditions [i.e., healthy full-term, preterm without BPD ['No BPD'], and preterm with BPD ['BPD']]. Peripheral blood samples were classified by infant age at time of collection [1-week, 1-month, and 36-weeks postmenstrual age]. Timepoints were stratified by BPD status. *Red boxes* highlight BPD levels across the 4 timepoints: cord blood, 1-week, 1-month and 36-weeks PMA.
